TITLE: Results of vertical ionospheric sounding at Tomsk  
during the IGY and IGC

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 9, 1962, 21, ab-  
stract 9G163 (Tr: Sibirsk. fiz.-tekhn. in-ta pri Toms-  
kom un-te, no. 38, 1960, 5-14)

TEXT: Experimental data on vertical ionospheric sounding are cited.  
They were obtained at Tomsk from observations in the period of the  
International Geophysical Year and International Geophysical Col-  
laboration (from July 1, 1957, to December 1959). It is shown that  
the change in the sunlit component of ionization in the F2 region  
proceeds during the year in accordance with the law of the sine of  
the sun's zenith angle. The seasonal change in the growth rate of  
ionization in the F2 region in the first half of the day conforms  
to the law  $\cos(\varphi + \delta)$ . The experimental data are presented as  
tables and graphs. / Abstracter's note: Complete translation. /

TITLE: Results of altitude sounding of the ionosphere in Tomsk, during the period of International Geophysical Year and International Geophysical Cooperation

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 8, 1962, 28, abstract 8Zh20U (Tr. Sibirs. fiz.-tekhn. in-ta pri Tomskom un-te, 1960, no. 38, 5-14)

TEXT: Experimental results are reported as obtained in vertical soundings of the ionosphere in Tomsk, in the framework of observational program during the International Geophysical Year and International Geophysical Cooperation (July 1, 1957 - December 1959). It is shown that the annual variation of solar illuminated component of the ionization of F<sub>2</sub> region corresponds to the sine law of zenith angle of the sun. Seasonal variations of the ionization increase rate for F<sub>2</sub> region during the first half of the day follow the cos ( $\varphi + \delta$ ) law. Experimental data are presented in tables and Card 1/2

TITLE:

Results of vertical sounding of the ionosphere at Tomsk during the International Geophysical Year and the International Geophysical Co-operation

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 10, 1962, 30, abstract 10-7-601 (Tr. Sibirsk. fiz.-tekhn. in-ta pri Tom'skom un-te, 1960, no. 38, 5 - 14)

TEXT: Observations were conducted on an automatic ionospheric station from July 1, 1957, to December 1959. The observations lasted 20 sec in the frequency range from 1 to 18 Mc. The following ionospheric characteristics were determined: 1) the critical frequencies of the ionosphere; 2) the heights of the major regions of ionization; 3) the factors of transmission ( $M3000$ )  $F_2$ , ( $M3000$ )  $F_1$  on a distance of 3,000 km; and 4) types of sporadic E layers. It is shown that a change of the solar radiation component of the  $F_2$ -region ionization in the course of a year takes place according to the sine law of the Sun's zenith angle, while

AUTHOR: Yelizar'yev, Yu. N.

TITLE: The yearly behavior of the rate of increase in the ionization of the F2  
region during the first half of the daySOURCE: Tomsk. Universitet. Sibirskiy fizikotekhnicheskiy Institut. Trudy\*,  
no. 41, 1962. Rezul'taty\* obrabotki materialov po issledovaniyu ionosfery\* i  
magnitnogo polya Zemli za period MGG i MGS, 49-54TOPIC TAGS: ionosphere, atmospheric ionization, F2 layer, atmospheric ionization  
diurnal variation, critical frequency diurnal variation, solar energy, sun spot ,ABSTRACT: From graphs representing the diurnal behavior of the critical fre-  
quencies for the F2 layer it can be seen that the change in the ionization  
condition of this region varies in character at different hours. The level of  
ionization (at Tomsk) of the F2 layer reaches its minimum value during the  
morning hours. In the evening hours, before sunset, when a decrease in ioniza-  
tion should be expected, either an increase is observed or else the ionization  
remains constant for a certain time. The reason for the formation of this  
evening maximum is not yet clear--all that exists is a hypothesis which explains

Card 143

ACCESSION NR: AT4013056

the phenomenon by alleging that, the evening maximum is caused by the compression of the upper layers of the atmosphere after the heating of the day. This led the author to study the character of the seasonal variation in the rate of the ionization increase in the F2 region (parameter  $V_{ion}$ ) during the first half of the day, from the morning minimum of critical frequencies. Toward this end, an f-graph of the median values of the critical frequencies was plotted for each month (Figure 1 in the Enclosure). The figure shows that the ionization for the F2 region increases from the morning minimum of critical frequencies during the first half of the day according to an almost linear law. Consequently, through that area of the f-graph where the greatest growth of critical frequencies occurs, a straight line was drawn, forming a certain angle  $\alpha^\circ$  with the time axis. Then  $\operatorname{tg}\alpha^\circ$  was determined for each month, characterizing the rate of increase of the ionization. The result was a picture of the variation in the rate of increase of ionization for the F2 region during the year, according to measurements carried out at the Tomsk Ionospheric Station during the period of the IGY and after. The author shows that the annual variation in  $V_{ion}$  and the annual change in the quantity of total solar energy reaching the Earth's atmosphere are inversely proportional. The annual amplitudes of the ionization increase rate are well defined by the mean-annual values of sun spot numbers. During the summer months, the ionization increase rate for the F2 region, at

TITLE: Dependence of ionospheric parameters on the admission of solar radiation into the earth's atmosphere

SOURCE: AN SSSR. Mezhdunovodstvennyy geofizichesky komitet. V razdel programmy

MGG: Ionosfera. Sbornik statey, no. 14, 1965. Ionosfernnye issledovaniya, 129-140

TOPIC TAGS: F layer, solar radiation effect, atmospheric ionization

ABSTRACT: This article presents data from a study of the relations between ionization parameters of the F2 layer and the zenith angle of the sun and the influx of solar energy into the earth's atmosphere. An investigation of the time variations of the diurnal increment of ionization, which represents the difference between critical frequencies at the maximum (midday hours) and minimum of the diurnal variation, showed that the maximal value of the increment of ionization is reached during the winter and the minimal value during the summer, and that during the year the change in the increment correlates well with the change of the sine of the zenith angle of the sun; the maximal values of the diurnal increment observed during the winter

Cara 1/4

L 43719-66

ACC NR: AT6023733

months change in proportion to solar activity, and during the summer months the increment remains approximately constant regardless of solar activity. On the basis of the widely held concept, confirmed by large-scale ionospheric observations, that the principal agent of ionization at the level of the F2 layer is solar wave radiation, a method of investigation is given to elicit the dependence of the state of ionization on the level of the wave radiation of the sun. It was found that the basic parameters characterizing the state of ionization are associated with the zenith angle and level of solar radiation, that the duration of illumination affects the state of ionization and the establishment of the phenomenon of limitation of an increase of ionization in the F2 layer, and that a radiation-type equilibrium state exists in the ionosphere during years of maximal solar activity and during the summer at moderate activity. It would be desirable to introduce into the annual data-analysis reports a section on the detection of a relation between ionization parameters and the level of wave radiation for each station based on the method presented. Orig. art. has: 9 figures and 12 formulas.

TITLE: Scientific Explorations in Siberia (Nauchnyye issledovaniya v Sibiri)

PERIODICAL: Priroda, 1958, Nr 7, pp 114-115 (USSR)

ABSTRACT: The XIIth Session of the Zapadno-Sibirskiy filial AN SSSR (West-Siberian Branch of the AS USSR) took place in Novosibirsk from 17 to 20 March 1958. Delegates from other important Soviet scientific centers attended the session. A total of 190 papers were delivered, of which over 50 served practical purposes. Professor T.F. Gorbachev, President of the Presidium of the West-Siberian Branch of the AS USSR and Vice-President of the Organization Committee of the Siberian Department of the AN USSR, evaluated the research results of the over 800 scientific workers of the institute, outlined the 1959 to 1965 plan assignments to the institute and commented on the establishment of the new large scientific center in the east of the country, the Sibirskoye otdeleniye AN SSSR (Siberian Department of the AS USSR). In the section for complex explorations of the water reservoir of the Novosibirskaya GES (Novosibirsk Hydroelectric Station), S.G. Beyrom and V.M. Samochkin spoke on the na-

Card 1/2

Scientific Explorations in Siberia

26-58-7-35/48

tural factors of the changes of the reservoir's banks. L.A. Lamin sketched the scientific bases of bank-preserving forest plantations. Professor V.V. Reverdatto discussed relics of the flora of Central Siberia from the Glacial period. A.V. Kuminova commented on the ecological composition of the flora of the Altay. M.F. Yelizar'yeva, Dotsent of the Krasnoyarskiy pedagogicheskiy institut (Krasnoyarsk Pedagogical Institute), spoke on plant life in the east border region of the West Siberian depression. Professor B.A. Tikhomirov discussed the basic problems and objects of study of the plant world and plant resources of the northern-most regions of Siberia.

TOPIC TAGS: ~~cosmology~~, atmospheric phenomenon, solar radiation, F layer

TRANSLATION: Results are given of studies made on the relationship between the minimum critical frequencies of the  $F_2$  layer with the ingress of solar energy into the Earth's atmosphere. The studies were made on the basis of data obtained by the Tomsk Ionospheric Station (1945-1960), as well as on data from the Moscow, Sverdlovsk, Irkutsk and Alma-Ata stations, obtained during the periods of IGY and the International Geophysical Cooperation. It is shown that there is a linear relation between the variations in the minimum critical frequencies of layer  $F_2$  ( $\delta F_2^{\text{min}}$ ) and the yearly ingress of solar radiation into the atmosphere. The character and amplitude of

TITLE: A Study of the Excitation of Rotational States in Some Diatomic Molecules in a Glow Discharge

PERIODICAL: Uch. zap. Tomskovo un-ta, 1958, Nr 32, pp 3-17

ABSTRACT: The author studied the excitation of rotational states in N<sub>2</sub>, CO and CN molecules in a glow discharge. It was found that the rotational temperature, ascertained from the spectral bands of these molecules, depends upon the gas pressure and the intensity of the discharge current. It is shown that the rotational temperature ascertained from the spectral bands of molecules which are little subject to chemical changes in the discharge, is equal to the temperature of a neutral gas. The rotational temperature ascertained from the band of the CN molecule which appears during the discharge itself as a result of chemical reactions, differs from the temperature of a neutral gas. The author calls

TITLE: Determination of Temperature from a Rotational Structure  
of the Bands of N<sub>2</sub>, CO and CN in a Glow Discharge.  
(Opredeleniye temperatury po vrashchatel'noy strukture  
polos N<sub>2</sub>, CO i CN v tleyushchem razryade.)

PERIODICAL: Optika i Spektroskopiya, 1957, Vol.III, Nr.1, pp.61-67.  
(USSR)

ABSTRACT: The gases N<sub>2</sub>, CO and CN were studied. The discharge  
tube was water cooled and fed with d.c. stabilized current.  
Certain measurements on mixtures of CO and H<sub>2</sub> were  
made using d.c. as well as a.c. current. Spectra  
produced in a positive column of the discharge were  
measured using a triple-prism glass spectrograph.  
Rotational temperature was determined from the bands:  
(0-3) 4059.4 Å of the second positive system of nitrogen,  
(0-2) 5198 Å of the Angstrom system of carbon dioxide and  
(0-1) 4216 Å of the violet system of CN. In the  
experiments on N<sub>2</sub>, CO and their mixtures about 10% of  
H<sub>2</sub> was used in order to make conditions the same as in

Card 1/3

51-1-8/18

Determination of Temperature from a Rotational Structure of the  
Bands of N<sub>2</sub>, CO and CN in a Glow Discharge.

the work of A.D. Karateyev (Ref.1) since some of his results are used by the author in the discussion. Values of rotational temperature were determined from intensity distribution of rotational lines in the bands listed above. The values of rotational temperature found by this method and dependence of this temperature on the discharge current and gas pressure are given in Tables 1, 2 and 3. Table 4 gives values of rotational temperature found using a.c. discharges. The d.c. and a.c. values of rotational temperature are practically identical. The N<sub>2</sub> and CO molecules both in ground and in excited states are distributed in rotational levels according to the Boltzmann law. Values of rotational temperature obtained from N<sub>2</sub> and CO bands were found to be the same and equal to the neutral gas temperature. Two Boltzmann distributions at two different temperatures were obtained for CN. The author thanks Professor N.A. Prilezhayeva for directing the work. There are 4 figures, 4 tables and 8 references, 5 of which are Slavic.

TITLE: A Study of the Temperature of the Gas in the Negative  
Glow and the Positive Column of a Glow DischargePERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,  
1961, No.1, pp.166-168

TEXT: The basic elementary process occurring in a glow discharge and leading to the heating of the gas, are elastic collisions between electrons and gas molecules, during which the electrons communicate some of their kinetic energy to the gas molecules. The energy thus communicated per unit time and unit volume is given by

$$\frac{dA}{dt} = \frac{2m_e \kappa N_e W_e^2}{\sqrt{\pi \lambda_e}}$$

(A. Engel' and M. Shtenbek, Ref.1), where  $m_e$  is the mass of the electron,  $\kappa$  is the fraction of energy lost by an electron to a molecule,  $N_e$  is the electron concentration,  $W_e$  is the most probable electron velocity and  $\lambda_e$  is the electron mean free path. It can be

shown from this expression that the temperature of the gas in the negative glow should be higher than in the positive column if diffusion is too weak to equalize the temperatures. The present work was designed to verify this point. The discharge was initiated in a water-cooled discharge tube incorporating inspection windows and hollow aluminium electrodes. The tube employed is shown in Fig.1. In this figure 1 and 2 are windows and 3 and 4 the electrodes. The internal diameter of the tube was 0.8 cm and the distance between the electrodes was 13 cm. The tube was d.c. operated and the spectrograms were obtained with a three-prism high-resolution glass spectrograph MCM-67 (ISP-67). An auto-collimating camera with a focal length of 3000 mm was employed (slit width 0.019 mm, exposure less than 4 to 5 hours). The temperature of the gas was determined from the intensity distribution for the rotational lines of the (0-3)  $\lambda$ 4059.4 Å band of the second positive nitrogen system (V. N. Yelizar'yeva, Ref.5). The pressure range was 0.2 to 0.7 mm Hg at a d.c. discharge current of 0.04 A. Measurements were also taken at 0.5 mm Hg with a discharge current between 0.03 and 0.06 A. The results obtained are

A Study of the Temperature of .... E032/E514

The fact that the temperature of the gas in the negative glow is higher than in the positive column is explained as follows. In this experiment the average thermal velocity of the nitrogen molecules was approximately  $5 \times 10^4$  cm/sec. Assuming that the distance between the negative glow and the positive column was 1 cm, it is estimated that the equalization of the temperature brought about by diffusion can take place in  $10^{-4}$  to  $10^{-5}$  sec. On the other hand, the time between electron-molecule collisions giving rise to the heating of the gas is about  $10^{-7}$  sec. It follows that the temperature equalization does not take place. Since the heating of the gas in the negative glow is more intensive than in the positive column, the above temperature difference will normally occur. There are 1 figure, 2 tables and 5 references: all Soviet.

Raised on Bottomland and Estuary Meadows.  
Orig Pub : Tr. N.-i. in-ta kormov i. pastbischch, 1957, 1, 101-109  
Abstract : According to tests made by the Institute in 1952-1955  
the best annual fodder crops on bottomland and estuary  
meadows are corn, sunflower, sudan grass and Hungarian  
grass. When planted on an overturned layer, these crops  
showed higher yields than when planted directly on the  
bed. The corn yields on bottomland and estuary meadows  
(300-482 centners per ha. of green stuff) were 4-7 times

Up-to-date Graduate Work Planning for Machine Construction  
Specialties (O sovremennom diplomnom proyekte po mashino-  
stroitel'nym spetsial'nostyam)

PERIODICAL:

Vestnik vysshey shkoly, 1958, Nr 8, pp 61 - 66 (USSR)

ABSTRACT:

By order of the Glavnaya upravleniya politekhnicheskikh i  
mashinostroitel'nykh vuzov Ministerstva vysshego obrazo-  
vaniya SSSR (Main Administration of Polytechnic and Machine  
Constructing Vuzes of the USSR Ministry of Higher Education)  
the authors familiarized themselves with the situation ex-  
isting in preparing graduate work for machine construction ex-  
isting at a number of vuzes. They found that much attention is  
being paid to the development of up-to-date processes and  
working out of machine designs. However, the quality of the grad-  
uate work is also rising. When examining graduate work, opin-  
ions differed mainly to the size and contents of the grad-  
uate work and the methods of its preparation. Present grad-  
uate work often consists of constructional, technological,  
organizational and economical parts which do not intercon-

Up-to-date Graduate Work Planning for Machine Construction Specialties APPROVED FOR RELEASE: 03/15/2001 CIA-RDP86-00513R001962610013-2 SOV-3-58-8-15/26

ASSOCIATION:

nect. This may be due to poor supervision on the part of  
councils and chairs of the institute and to the fact that  
the subjects for graduate work and the tasks involved were  
not considered carefully. In this connection the authors  
mention the Gor'kovskiy politekhnicheskiy institut (Gor'-  
kiy Polytechnic Institute), and the Moskovskiy aviatson-  
nological Institut (Moscow Aeronautical-Tech-  
nological Institute). They come to the conclusion that  
the preparation of the graduate work for machine construc-  
tion specialties does not yet meet increased qualificaton  
requirements of future specialists. The authors give some  
advice for the improvement of the quality of graduate work.

TITLE: Planning of Vuz Degrees Under Present Conditions

PERIODICAL: Vestnik vysshey shkoly, 1959, Nr 4, pp 14-19 (USSR)

ABSTRACT: The training of specialists at higher schools is being reorganized at present. The planning of the diploma design presents an important stage in this training. The state of design planning in several machine building vuzes indicates that in the majority of graduation works, sufficient attention is paid to developing modern machine designs and methods of their production, and that a considerable number of projects are based on realistic themes. This means that on the whole the planning of diploma designs in machine building specialties is satisfactory. However, because of insufficient connection between the higher school and production places, and as the students' training does not fully reflect problems relating to the theory and prospects of development of science

Card 1/3

SOV/3-59-4-3/42

Planning of **Vuz Degrees** Under Present Conditions

and engineering, the planning of designs is in several vuzes not in accordance with the requirements. Practice shows that the diploma designs worked out by students of correspondence vuzes more often meet the demands of industry than those prepared by day-time institutes. The authors mention in this connection several complicated technical problems which were sufficiently elaborated in graduation designs handed in to the Vsesoyuznyy zaochnyy politekhnicheskiy institut (VZPI) (All-Union Polytechnical Correspondence Institute). They point out substantial shortcomings existing in both the regular and correspondence vuzes in regard to the graduation designs and indicate the ways how to overcome them. In order to raise the practical value of students' works, it is expedient that a group of students be entrusted with a complicated theme. As an example the authors take an automatic line for machining of electric motor shafts, developed by the Eksperimental'nyy nauchno-issledovatel'stvo institut metalloregushchikh stankov (ENIMS) (Experimental Scientific-Research Institute of Metal-

cutting Machine Tools). In the authors' opinion the graduation design of a future mechanical engineer of various machine building branches should consist of the following basic interconnected parts: designing, technological, and organizational - economical. Safety should also be reflected in the projected machine or technological process, and not in a separate section of the work. In conclusion the authors set forth a number of recommendations which are based on their own practice and the experience of other vuzes.

TOPIC TAGS: machinery, machine engineering, machine durability, machine part life, part resistance, metal wear, metal strengthening, machine fabrication

PURPOSE and COVERAGE: This book is intended for mechanical engineers at plants and scientific workers at research institutes who are engaged in designing and manufacturing of machines. It may also be useful to designers for technological work carried out to fabricate new or modernize old machines and to students of high level education attending the course "Machine-building Technology." This book describes modern technological methods applied to increase the durability and reliability of machines. Information on the wear of metals and the effect of technological factors on the durability of machine parts is presented. Methods of determining the durability and reliability of machine parts and subassemblies are described along with the physical principles of their strengthening and the machining methods used for this purpose. Organizational and economic problems connected with designing and fabricating durable and

AUTHOR: Yelizev, V.F.

TITLE: Methods for generating a discrete spectrum of stable frequencies with the aid of a pulse-self-oscillator with controlled initial phase

PERIODICAL: Elektrosvyaz', no. 4, 1962, 28 - 32

TEXT: This article is a general survey of the main peculiarities, advantages and defects of several methods permitting the generation of a discrete spectrum of stable frequencies in the ultrashort-wave range (30 - 100 Mc/s) with the aid of a pulse-self-oscillator. Three methods are examined, all of them being essentially based on the possibility of controlling the initial phase of the pulse-oscillator self-oscillation setup process with the aid of the oscillations of an exterior reference oscillator. 1) Method using a quartz reference oscillator operating at a frequency near to the natural frequency of the pulse-self-oscillator. The main parts of this system are the pulse-self-oscillator, the quartz reference oscillator and a generator of keying pulses. 2) Method using the higher harmonic components of the oscillations of the reference oscillator, these

harmonic components being used here for controlling the initial phase of the self-oscillation process of the pulse-oscillator. The main parts of this system are the pulse-self-oscillator, the quartz oscillator, a harmonic generator, a keyer and a frequency divider. 3) Method using a pulse-self-oscillator with a stable keying frequency, the initial phase of the self-oscillation process being controlled by the oscillations of an auxiliary oscillator generating a continuous frequency spectrum. The main parts of this system are the pulse-self-oscillator, the auxiliary oscillator, a keyer, a mixer and a retunable filter. The Soviet personalities mentioned in the article are: V.I. Grigulevich. There are 3 figures and 2 references: 1 Soviet-bloc and 1 non-Soviet-bloc.
